

Mark-down: Exaggerated from work

— but volume would also have to be given unless there is perfect elasticity.

Steel, pulp, etc. "world market price"

Probability of a converging adjustment starting from a given price → mark-down

to establish equilibrium — see how far you can adjust price to get

more volume (or how far you can

they adjust with a scheduled amount at high price

Difference between primary for a

product structure what is already there, and a product which together with the whole system is still only contemplated.

In the latter case the perfect market conditionally matters.
